INTRODUCTION

Food security, population growth, according to the Natural Resources Limited is one of the most important issues in the world is. The most important sources of heavy metal contamination of natural resources are Ghyrnqth. Annual global scale, thousands of these elements in the soil system (Taylor et al., 1999). Since agricultural products contaminated with heavy metals resulting in decreased quality of agricultural products on the one hand and the other hand is a serious threat to human health, the environmental aspects are very important. Accumulation of heavy metals and increase their concentration and achieve the exposure can be by entering the human food chain, his health was seriously threatened (Sui et al, 2005). Among the heavy metals, some of them, such as zinc, copper, and cobalt values are essential for many biological systems, including humans (Samarkand, 1379, Shokrzadeh, 1390). While some other heavy metals such as cadmium, lead and arsenic in plants, animals and humans are highly toxic (Kabata, 2011; Li X, et al, 2004). Cadmium is a known carcinogen in the development of most cancers (Valks, 2003, a tour Duggan et al, 2003). And it seems to be crucial factors in the development of heart disease and high blood pressure (Edmonds, 1996). Lead can also affect the blood system and kidneys, causing metabolic disorders and neuro-physical defects in children. Hmchnyngzarsh that if large amounts of heavy metals such as lead, into the body of the pregnant women, premature birth and babies with severe mental retardation will be greatly increased)WHO, 2003; Zadrzdzy et al, 2003). Plants can see without damage high levels of cadmium in their gathering (Alva, 1995) stated thatrelatively high concentrations of cadmium can accumulate in the edible parts of plants, without obvious symptoms affecting plant be. Cd accumulation in plants can increase the potential of this nutrient by humans and this is done in the case that these plants are part of the diet (Kabata, 2011). Radu and colleagues,(2006) to raise awareness in public opinion in Egypt for evaluation of heavy metals to agricultural products from analysis of several samples of agricultural products, including strawberry, cucumber, dates and batch of their vegetables. With respect to the carcinogenic effects of two cadmium, lead, zinc and copper, and usefulness of the diet in adequate level in the four elements measured in the products listed. Although the results of their study showed that leafy vegetables such as lettuce and spinach had the highest levels of lead and cadmium in other products, were but they estimate the value of the daily intake of these nutrients in agricultural products tested, this value is less than the reported WHO and FAO knew. Removing heavy metals from contaminated soils by plants, especially agricultural products is one of the most important ways of entering the food chain elements (Fuji et al. 11, 2008). Annually, about 38,000 tons of cadmium and almost a million tons of lead in soils worldwide added that large amounts of the dust atmosphere, scattering the ashes and municipal waste and low concentrations of the chemical fertilizers and sewage sludge is (Anryagv and et al. 12, 1988). Two heavy metals lead and cadmium is a crucial element in the development of cancer, particularly gastrointestinal cancer known (Valks, 2003; Tvrdvgn et al., 2003). The aim of this study was to

evaluate the concentration of lead and cadmium in products Shah spinach vegetable garden cultivated lands in the city of Ardabil. Food safety is one of the underlying principle of all societies, which all countries in the provision of due diligence with regard to the facilities and conditions to work Brnddr among vegetables as a member of the food basket of stressed health experts and the traditions of Islam as well as the vegetables mentioned as a table ornament. Naturally healthy vegetables can play a significant role in the health of consumers. After the industrial revolution and the scientific progress of mankind login environmental pollutants to water, soil and air as well as increased entry of these compounds to plants, especially vegetables through water, soil and the use of pesticides threaten the health of consumers has made a serious matter. Heavy metals into the food chain and reach a critical concentration of metabolic and physiological adverse effects on living organisms rather than leave cadmium atomic weight element is 4/112 that may cause kidney damage, hypertension, cancer, mutant Shvd.srb job atomic number 82 are three important system of the human body, the hematopoietic system, nervous system and kidneys are sensitive to it (principal, and et al., 1389). This study aimed to determine the amount of lead and cadmium in products as hazardous heavy metals (spinach and watercress) Ardabil vegetable gardens. According to the consumption of contaminated vegetables and consequently illnesses associated with the consumption of certain types of cancer, kidney disease, nervous system and direct and indirect costs to society of each country. So it is necessary to impose appropriate research related with this in Ardebil vegetable gardens are fulfilled.

Geographic and climatic issues

Location

Ardabil province with an area of about 17867 square kilometers, about 1.1 percent of the country's total area in the North West of Iran (East Azerbaijan and Northern Plains), is located.

Ardabil city, in an area with geographical coordinates 48 and °47 ° to 39°48 degrees east longitude and 56 degrees °37 to 33 and °38 north latitude, is located. The city of Ardabil Plain at an altitude of 1340 meters above the sea level.

According to the latest population census in 1390 in Ardebil city population is 485,153 people. (Statistical Yearbook governor of Ardebil 1391)

Due to cold weather conditions Ardabil in the year just within five months of June to October planting vegetables takes place in the city of Ardabil (urban and rural) 40 Vegetable garden is the active part in this study because of limitations (time, access laboratory, etc.) 10 within the range of Ardabil Bagh Dar selection and preparation began on March 93 was set Specification Sheet vegetable gardens and during the months of June, July and Persian date Mordad 1394 sampling preparation and testing was done.

Research Methodology

The study was a cross-sectional Bvdhv amount of heavy metals (cadmium and lead) in Shah spinach farmed vegetables in gardens within the city of Ardabil were

investigated. First, the water used to irrigate gardens as well as cultivated soils were sampled.

Sample of spinach, cress was performed three times in June, July and Persian date Mordad 1394. The samples using standard preparation procedures and atomic absorption

using a Model Perkin Elmer build Islamic Azad University to determine the amount of lead and cadmium was used for analysis of variance was used spss software. Samples of soil and water and vegetable products (spinach and watercress) 10 months of June, July and vegetable garden Persian date Mordad 1394 was performed. In the case of plants during three sampling in June Tiro Persian date Mordad 94 13 per Mrhlhnmvnh taking a sample of any vegetable garden cress, spinach and a sample was taken that the total sample was 81. How sampling of vegetables so that each garden plots cultivated spinach and watercress random sampling of at least 10 plants weighing about 200 g and the samples were mixed with each other.

Water samples (10 samples) after being transported to the laboratory by adding 5 ml of nitric acid in 100 mL of water to stabilize Grdyd.nmvnh soil (10) for the preparation of a composite sample of 5 to 6 points of the garden from the

Table 1 shows the results of measurement of lead and cadmium in soil and water samples spinach and watercress vegetable gardens were the first sampling stage (June 1394)

Garden Number	Water cadmium (Ppm)	Lead water (Ppm)	Cd (Ppm)	Lead dust (Ppm)	Cadmium spinach(Ppm)	Lead spinach(Ppm)	Cd King(Ppm)	Lead King (Ppm)

depths zero to 30 cm were prepared. after drying air was passed through the sieve.

Data collection method

Through field studies, library and tools (sampling and test) was performed. Information from databases, owners and stakeholders were prepared gardens.

Data collection

Information required by authorities library resources and online sampling and analysis in the laboratory, respectively.

Methods of data analysis

The results of the measurement of heavy metals in any product in the garden for each month via standard EPA were compared for differences between products as well as gardens in the city of ANOVA for comparison of the t-test was used to analyze and analyzed using SPSSsoftware was performed.

The results of the sampling

Table 3 shows the results of assessment of cadmium and lead in samples of spinach and watercress water sampling in the third phase (August 1394)

Garden Number	Water cadmium (Ppm)	Lead water (Ppm)	Cadmium spinach (ppm)	Lead spinach (ppm)	Shahi cadmium (ppm)	Lead King (Ppm)

Conclusion

As At results Analysis Variance Specified Is Fortunately average amount Lead And Cadmium At All Sample Of Water, soil, Spinach And Shahi Case review Kmtrazhd Standard The Is And this order Marker Lack Contamination Acute gardens Under Research With Metals heavy The Is.

At Case Sample Of Water gardens At Sample Of First during June the moon 1394 Sample Water Garden Number 1 Contamination Cadmium The Is And Water gardens Number 2 and 3 amount little Wet Pollution Cadmium have And water Other gardens Lacking Contamination Cadmium The Is. The reason? Actually Become gardens 1, 2, 3 Range City And Use From Water Well For Irrigation To special Garden Number 1 Inside Area Urban, That Adjacent With Home Of Residential The Is. Contamination Cadmium The Can Due From Influence Wastewater Azchahhay Catchy The residential area Is but in the water gardens 4 to 10 At Area Agriculture And To far way From areas Residential The Is nothing Species Contamination Cadmium Observation Not Is.

The measurement results values pH soil Of gardens The study showed that all soil And Alkaline Been And pH It And higher May 7 Is. Measure the amounts of heavy metals in soil showed a mean vegetable gardens Cadmium And Lead little Wet From Limit Standard The Is.

On Basis results T test Independent Specified Was That amount Absorption And Aggregation Cadmium At Spinach more From Shahi The Is And this Marker this Is That Each How many plant Flat Leaf Wet Is Possibility Aggregation Cadmium more Is. The results chary (2007) in India around the Musi River showed a risk factor for heavy metals in leafy vegetables, especially spinach and amaranth is high. Because the conductivity and transpiration rate is high in these vegetables as well as broad leaf plants more susceptible to physical contamination by dust from the soil that the survey correspond with the study.

point Jalbyklydy this Research this Is That between results the level First Sample Vector At June 94 months levels Second And Third At July And August the moon Difference Clear Existence has it To As At Some From Sample And At the level First Cadmium And Lead However, Most less From Standard Observation Was but At All Sample Of levels Second And Third Including From Water, Spinach And Shahi amount Cadmium And Lead Zero measurement Was.

At review Cause Issue Discuss Of Different Can be involved. Including With Attention To this That At Area The Ardabil About Five the moon Culture And Removal vegetable To Action The Is And Actually more From Six the moon Water Well And the gardens are not used Cadmium accumulation of cadmium in the samples of the first phase of gardens in wells 1, 2 and 3 in the metropolitan area is located adjacent to residential homes Have Happening The Falls And To Consequently It Products China First Spinach And Shahi too Contamination little Cadmium And sign The Day but At Effect Use From Water And too Removal Of Multiple Vegetable Actually this Integration And Aggregation Metals heavy At China Of Second And Third Zero The Is. So consideration The Is

Products vegetable China Of First From Opinion Metals heavy Polluted From China Of Second And Third The Is.

In the case of cadmium spinach in China, one in three gardens 3, 6 and 10. It is explained in the garden (3) the amount of cadmium in the water garden is higher than that in spinach condensed also is in the gardens of 6 and 10 Cadmium a small amount of garden soil that is high in spinach condensed product is then taken as a result of bioaccumulation is spinach.
